Problem Statement:

Many veterans encounter serious challenges when transitioning from military service to civilian careers. While they possess valuable leadership, technical, and problem-solving skills, these competencies are often not recognized or translated effectively into civilian job requirements. At the same time, gaps in formal education or civilian certifications can make it harder for veterans to compete in the job market. This disconnect results in underemployment, extended job searches, and frustration for veterans eager to build meaningful post-military careers. Addressing this problem requires solutions that bridge the gap between military experience and civilian educational or industry standards.
